

CLAIMS:

1. (currently amended) A container for heating material within it and for dispensing said material once heated, the container comprising:

- (a) a first compartment for location of the material, and
- (b) a second compartment for receiving a hot liquid, the second compartment being isolated from the first compartment such that liquid in the second compartment and material in the first compartment cannot mix; the second compartment being in thermal communication with the first compartment; wherein the second compartment has an inlet for the introduction of the hot liquid, the inlet having a removable closure; **and**

wherein the first compartment has a restricted outlet in the form of an applicator for prolonged dispensing of heated liquid material in the container, the applicator being adapted to apply a film of the material to a surface, the outlet having a removable closure; **and**

whereby the first and second compartments are separated by a dividing wall that extends between and is connected to the outer wall of the container, thereby dividing the container into two end-to-end compartments.

2-5. (cancelled)

6. (currently amended) A container as claimed in any preceding according to claim 1 wherein the applicator is removable, thereby to permit removal of introduction of the material into the first compartment.

7. (currently amended) A container according to any preceding claim 1 wherein the applicator comprises a narrow elongate slot through which the heated liquid material can be expressed.

8. (currently amended) A container according to ~~any of claims~~ claim 1 or 6, wherein the applicator comprises a roller or roller ball.

9. (currently amended) A container according to ~~any preceding~~ claim 1, wherein a layer of thermal insulation surrounds or is provided at in the outer wall of the container.

10. (currently amended) A container according to ~~any preceding~~ claim 1, comprising which additionally comprises heat indication means to indicate when the temperature of the material in the first compartment has reached a desired temperature.

11. (original) A container for heating material within it and for dispensing said material once heated, the container comprising:

- (a) a first compartment containing the material, the material at ambient temperature being a solid or a liquid and at an elevated temperature being a liquid or a vapour (in the case of a solid at ambient temperature) or a less viscous liquid or a vapour (in the case of a liquid at ambient temperature);
- (b) a second compartment for receiving a hot liquid, the second compartment being isolated from the first compartment such that the hot liquid and the material cannot mix, the second compartment being in thermal communication with the first compartment;

wherein the second compartment has an inlet for the introduction of the hot liquid, the inlet having a removable closure; and

wherein the first compartment has a restricted outlet adapted for prolonged dispensing of the heated material within it, said outlet having a removable closure; and

whereby the first and second compartments are separated by a dividing wall that extends between and is connected to the outer wall of the container, thereby dividing the container into two end-to-end compartments.

12. (original) A container according to claim 11 wherein the first compartment contains epilatory wax.

13. (currently amended) A method of dispensing heated material from a container as claimed in claims 11 or 12, comprising the steps of: introducing hot water into the second compartment; and closing the inlet thereof using the its closure; and permitting or causing the heated material within the first compartment to be dispensed through the restricted outlet.

14. (cancelled).
